# Improvement of stability of Nb<sub>3</sub>Sn superconductors by introducing high specific heat substances

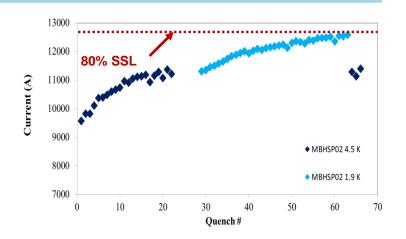

-- Xingchen Xu, Sasha Zlobin, Pei Li

## **Motivation**

Nb<sub>3</sub>Sn magnets: slower training rate than NbTi. May be a potential problem for large projects (e.g., FCC: 14% margin, ~5000 dipole magnets).

## Slow training because:

- $ightharpoonup Nb_3Sn$  is intrinsically less stable than NbTi (larger  $D_s$ , higher  $J_c$ )
- Epoxy impregnation (poor dynamic stabilization, epoxy cracking)
- Other perturbations

#### How to solve?

For intrinsic instability:  $\frac{\mu_0 J_c^2 d_{eff}^2}{4C(T_c - T_b)}$  < 3 (adiabatic), RRR (dynamic)

For external perturbations: try to be less sensitive to them:  $\Delta T = Q/C$ .

How to increase *C* of conductors/cables/coils?

Add substances with high C: Gd<sub>2</sub>O<sub>3</sub>, PrB<sub>6</sub>, CeCu<sub>5</sub>, etc.

Not a new idea.

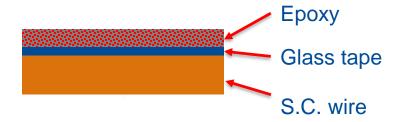

The question is, how to do this practically.

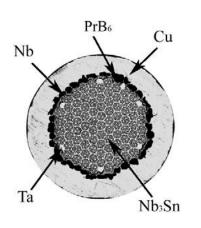

# How to add high-C substances in?

We have considered various ways of applying this idea practically:

1. Add such powders to epoxy: effectiveness

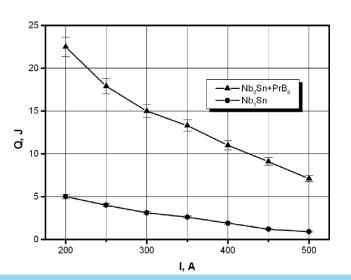

- 2. Coat such powders onto cables? Cracking during winding?
- 3. Add such powders directly to Nb<sub>3</sub>Sn wires? Need to find a proper wire design.

#### **Problems:**

- . Difficult to do
- 2. Difficult to draw

Increasing *C* is a correct direction to go, but the key issue lies in how to do it practically.

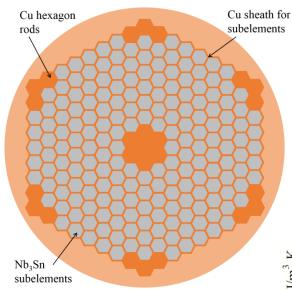

Keilin V E et al. 2009 Supercond. Sci. Technol. 22, 085007

## Our scheme

We decided to add high-C materials directly into Nb<sub>3</sub>Sn wires. ... and, thanks to the design of modern high- $J_c$  Nb<sub>3</sub>Sn wires:

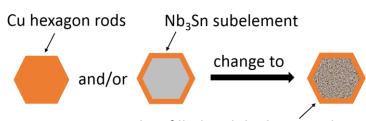

### Distributed-barrier Nb<sub>3</sub>Sn wires:

We use  $Gd_2O_3$  due to its availability and high C:

- $\triangleright$  2 K:  $C(Gd_2O_3)/C(Cu)=1000$
- $\rightarrow$  4.2 K:  $C(Gd_2O_3)/C(Cu)=170$
- 9 T does not suppress its C

Our scheme:

Cu tubes filled with high-C powders

We use mixture of Cu & high-C powders instead of pure high-C powders.

This modification brings two advantages:

- (1) Enhance thermal conduction
- (2) Draw better

	(2) Diaw botton

**Fermilab** 

# **Measurements of stability**

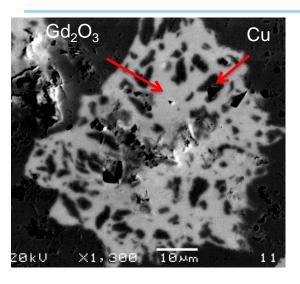

Minimum quench energy (MQE) measurements:

640°C/200h, non-Cu  $J_c$ s at 4.2 K, 14 T: 1220 and 1310 A/mm<sup>2</sup> for control and high-C wire.

# **Further optimizations**

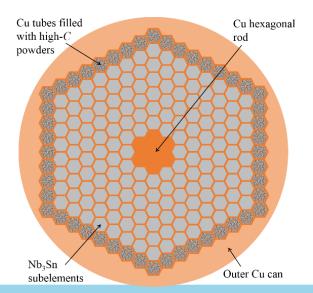

Cu/Gd<sub>2</sub>O<sub>3</sub>=0.5. Cu forms isolated islands in Gd<sub>2</sub>O<sub>3</sub>: only a surface layer can absorb heat.

## Optimization 1: Cu/Gd<sub>2</sub>O<sub>3</sub> ratio & mixing

- ➤ Ideal structure: Cu forms a continuous network, dividing Gd<sub>2</sub>O<sub>3</sub> into small islands (sub-micron scale).
- ➤ Will try different Cu/Gd<sub>2</sub>O<sub>3</sub> ratios.
- This could make the stabilization effects more significant.

## **Optimization 2: wire design**

Most effective design:

For this 271-Re design, the fractions are:

- ➤ Nb<sub>3</sub>Sn subelements: ~43% of the wire;
- $\rightarrow$  Gd<sub>2</sub>O<sub>3</sub>: ~2% (by assuming Cu/Gd<sub>2</sub>O<sub>3</sub>=3)

2 vol.% Gd<sub>2</sub>O<sub>3</sub> improves *C* of a Nb<sub>3</sub>Sn wire by 20 times at 2 K; by 4 times at 4.2 K.

Price? 1 kg Nb<sub>3</sub>Sn wire needs 17 g Gd<sub>2</sub>O<sub>3</sub>. Gd<sub>2</sub>O<sub>3</sub> powder (99.9%, 10-100 nm) is <\$800/kg, half of Nb<sub>3</sub>Sn wires (\$1700/kg).

# **Summary**

- 1. The goal of this project is to combat instability and slow training rate of Nb<sub>3</sub>Sn magnets.
- 2. The method is to increase the specific heat capacity, which not only makes superconductors intrinsically more stable, but also makes them less sensitive to external perturbations (i.e., improvement of energy margin against quenches).
- 3. A method is put forward to add high-C substances to Nb<sub>3</sub>Sn wires, which:
  - Adds minimum difficulty to wire fabrication and drawing
  - Does not harm RRR or non-Cu J<sub>c</sub>
  - Reduces flux jump amplitudes
  - Improves MQE values significantly
- 4. Further optimization can lead to more significant stabilization.
- 5. We have started a contract with Bruker EAS and OST to make long wires.
