Light-Cone Physics and Large-Momentum Effective Theory

Yong Zhao
Massachusetts Institute of Technology

13th Conference on the Intersections of Particle and Nuclear Physics
Palm Springs, CA, 05/29-06/03, 2018
Outline

• Hadron structure and the parton model
  o Infinite momentum frame and the light-cone
  o First-principle calculation of parton physics

• Large-momentum effective theory
  o A novel approach to calculate light-cone observables

• Parton physics from lattice QCD
  o Gluon helicity
  o Parton distribution function
Outline

• Parton physics from lattice QCD
  o Gluon helicity
  o Parton distribution function
One of the most important goals of high-energy and nuclear physics today is to understand the inner structure of the hadrons:

To see the quarks and gluons inside the proton you have to smash it!

~1fm=197 MeV^{-1}
Feynman’s Parton Model

- Hadrons in high-energy scattering

Infinite momentum frame (IMF): Quarks and gluons “frozen” in the transverse plane due to Lorentz dilation effect.

Parton model: hadron as a beam of free particles with certain momentum density.
Parton Distribution Functions (PDFs)

- PDFs are the basic inputs for making standard-model predictions in high-energy scattering.

QCD Factorization theorem:

\[ \sigma = \sum_{a,b} f_a(x_1) \otimes f_b(x_2) \otimes \sigma_{ab} \]

\( \sigma_{ab} : \)

- Contributions from low energy, or, infrared (IR) degrees of freedom;
- Intrinsically nonperturbative.

\( f_a(x), f_b(x) \) are universal properties of the hadron:
Theoretical uncertainties in the gluon-gluon fusion Higgs production cross section ($M_H=125.09$ GeV) at $\sqrt{s}=13$ TeV at $N^3$LO QCD and NLO electroweak accuracies.

PDFs from Phenomenology

• So far our best knowledge of the PDFs comes from the global analysis of high-energy scattering data, but a first-principle calculation is still behind our time.

1. First-principle calculation can cover kinematic regions and flavor structures where experiments cannot constrain so well;

2. The cost of improving calculations can be much smaller than building larger experiments.

Parton Physics and the light-cone

• Instead of using the IMF, PDFs are often equivalently defined from correlation functions on the light-cone.

• Definition of PDF:

\[
q(x, \mu) = \int \frac{d\xi^-}{4\pi} e^{-ixP^+\xi^-} \langle P| \bar{\psi}(\xi^-) \gamma^+ U(\xi^-, 0) \psi(0)|P \rangle
\]

\[
U(\xi^-, 0) = P \exp \left[ -ig \int_{\xi^-}^{0} d\eta^- A^+(\eta^-) \right]
\]

\[
P^\mu = (P^z, 0, 0, P^z)
\]

\[
\xi^\pm = (t \pm z) / \sqrt{2} = 0
\]

• Gauge-invariant and boost invariant (independent of \(P^z\));

• In light-cone quantization (\(A^+ = 0\)), clear density interpretation.

\[
q(x, \mu) \sim \int dk^+ d^2k_{\perp} \delta(k^+-xP^+) \langle P| \hat{n}(k^+, k_{\perp})|P \rangle
\]
Lattice QCD Calculation of parton physics?

- Lattice gauge theory (K. G. Wilson, 1974)

  o Monte Carlo simulation of QCD on a discretized Euclidean lattice
  o Tremendous successes in hadron spectroscopy, decay constants, strong coupling, form factors, etc.

See talks by J. Dudek and A. Nicholson.
Lattice QCD Calculation of parton physics?

However, parton physics usually cannot be directly calculated from the lattice:

- **Parton physics**
  - Minkowski space, real time;
  - Emerges in the IMF, or equivalently, on the light-cone.

- **Lattice QCD**
  - Euclidean space, imaginary time ($t=\text{i}\tau$);
  - General difficulty of analytical continuation in time or fixing the light-cone.

\[
e^{is} \rightarrow e^{-s}
\]

\[
\langle O \rangle = \int D\psi D\bar{\psi} DA \, O(x)e^{-s}
\]

\[
x_E^\mu x_E^\mu = 0 \rightarrow x^\mu = (0,0,0,0)
\]
Early attempts of lattice calculations

Computation of the Mellin moments of the PDF:

$$\int_{0}^{1} dx \ x^{n} q(x, \mu) dx = a_{n}(\mu) \propto \langle P | \bar{\psi}(0) \gamma^{+} i \tilde{D}^{+} \cdots i \tilde{D}^{+} \psi(0) | P \rangle$$

- Local operators are calculable on the lattice;
- Fitting the PDF with a parametrized form from the moments;
- Due to broken Lorentz symmetry, operator mixing limits the number of calculable moments to no more than 3.

Can we directly compute the x-dependence?
Outline

• Hadron structure and the parton model
  o Infinite momentum frame and the light-cone
  o First-principle calculation of parton physics

• Large-momentum effective theory
  o A novel approach to calculate light-cone observables

• Parton physics from lattice QCD
  o Gluon helicity
  o Parton distribution function
A novel approach to calculate light-cone observables

Large-momentum effective theory (LaMET) expands in powers of $1/P^z$, where $P^z$ is the hadron momentum (Ji, PRL 2013, Sci. China Phys. Mech. Astro., 2014):

1. Construct a Euclidean quasi-observable $\tilde{O}$ which can be calculated in lattice QCD;
2. The IMF limit of $\tilde{O}$ is constructed to be a light-cone observable $O$ at the operator level;

For example, the quasi-PDF is defined from equal-time correlation along the $z$-direction:

$$\tilde{q}(x,P^z,\mu) = \int \frac{dz}{4\pi} \ e^{ixP^z} \left\langle P | \bar{\psi}(z)\gamma^z U(z,0)\psi(0) | P \right\rangle$$

$$U(z,0) = P \exp \left[ -ig \int_0^z dz' A^z(z') \right] \quad z^\mu = (0,0,0,z)$$
3. The matrix element of $\tilde{O}$ generally depends on $P^z$ because it is not boost invariant, whereas that of $O$ is independent of $P^z$;

$$\tilde{O}(P^z, \tilde{\mu}) = \langle P = P^z | \tilde{O} | P = P^z \rangle,$$

$$O(\mu) = \langle P = \text{any} | O | P = \text{any} \rangle$$

4. Taking the $P^z \to \infty$ limit of $\tilde{O}(P^z, \tilde{\mu})$ is non-analytical due to the singularities in quantum field theory;

$$\lim_{P^z \to \infty} \tilde{O}(P^z, \tilde{\mu}) = ?$$
5. Nevertheless, at large $P^z$, $\tilde{O}(P^z, \tilde{\mu})$ can be related to $O(\mu)$ through a factorization theorem:

$$\tilde{O}(P^z, \tilde{\mu}) = Z\left(\frac{\tilde{\mu}}{\mu}, \frac{\mu}{P^z}\right) \otimes O(\mu) + O\left(\frac{\Lambda_{QCD}^2}{P^z}, \frac{M^2}{P^z}\right)$$

$$O(\mu) \cong Z^{-1} \otimes \tilde{O}(P^z, \tilde{\mu})$$

- $O(\mu)$ and $\tilde{O}(P^z, \tilde{\mu})$ have the same IR physics (nonperturbative), but different ultraviolet (UV) physics (perturbative);
- $Z(\tilde{\mu}/\mu, \mu/P^z)$ matches the UV difference, and can be calculated precisely in perturbation theory.
Progress in the theoretical development of LaMET

• **Renormalization:**

• **Factorization:**

• **One-loop matching:**

• **Power corrections:**

• **Transvers momentum dependent parton distribution function:**

First calculation of gluon helicity from lattice QCD

\[ \Delta G(\mu^2 = 10\text{GeV}^2) \approx S_G(\infty, \mu^2 = 10\text{GeV}^2) = 0.251(47)(16) \]
Gluons Provide Half of the Proton’s Spin

The gluons that bind quarks together in nucleons provide a considerable chunk of the proton’s total spin. That was the conclusion reached by Yi-Bo Yang from the University of Kentucky, Lexington, and colleagues (see Viewpoint: Spinning Gluons in the Proton). By running state-of-the-art computer simulations of quark-gluon dynamics on a so-called spacetime lattice, the researchers found that 50% of the proton’s spin comes from its gluons. The result is in agreement with recent experiments and shows how such lattice simulations can now accurately predict an increasing number of particle properties. The simulations also indicate that, despite being substantial, the gluon spin contribution is too small to play a major part in “screening” the quark spin contribution—which according to experiments is only 30%—through a quantum effect called the axial anomaly. The remaining 20% of the proton spin is thought to come from the orbital angular momentum of quarks and gluons.
Lattice calculation of the iso-vector PDF $u(x) - d(x) - \bar{u}(-x) + \bar{d}(-x)$

C. Alexandrou, K. Cichy, M. Constantinou, K. Jansen, A. Scapellato, and F. Steffens, (ETMC), 2018

Clover valence fermions on $N_f=2+1+1$ flavors of HISQ generated by MILC, $a=0.09$ fm, $L=5.8$ fm, $m_\pi \sim 135$ MeV, $N_{cf}=310$, $P^z=3$ GeV.

Dynamical $N_f=2+1+1$ twisted mass fermions by ETMC, $a=0.09$ fm, $L=4.8$ fm, $m_\pi \sim 130$ MeV, $P^z=1.4$ GeV.

A long way to here after over 3 years of dedicated efforts!
Summary and outlook

• A systematic lattice QCD calculation of parton physics from LaMET is making vigorous progress.

• In 5~10 years, expect:
  o Lattice calculation of quark PDFs to be within 10% accuracy or even better;
  o Constraints on the flavor structure of PDF at $x \sim 1$ and the sea quark distributions be better than experiments;
  o Reaching smaller $x$ region with larger nucleon momentum;
  o Lattice calculation of other distributions including TMD, GPD, gluon distributions, etc...
The next frontier of QCD

Electron-Ion Collider!

- Highly Polarized Beams
- Large Kinematic Range
- High Collision Luminosity

3-D tomography of the nucleon:
- More precise PDFs
- Sea quark distributions
- Gluonic structure of nucleon and nuclei
- Small-x physics
- Gluon spin and parton orbital angular momentum
- TMDPDFs, GPDs, Wigner distributions
- ......
