

# Evaluations for medium- and high-mass nuclei for FUSION applications

Gustavo Nobre, Dave Brown

*National Nuclear Data Center*

*Brookhaven National Laboratory*

@BrookhavenLab

WANDA - Workshop for Applied Nuclear Data Activities

Fusion Neutronics session

Crystal City, VA - February 26-29, 2024

# Outline

- ITER
- What's in ITER?
  - Which evaluations are relevant to ITER and other fusion applications?
- What are some of the challenges in evaluating these materials?
- Status of these evaluations in the ENDF/B library

# ITER

*In southern France, 35 nations\* are collaborating to build the world's largest tokamak, a magnetic fusion device that has been designed to prove the feasibility of fusion as a large-scale and carbon-free source of energy based on the same principle that powers our Sun and stars.*

- ITER ("The Way" in Latin) is one of the most ambitious energy projects in the world today.
- The experimental campaign that will be carried out at ITER is crucial to advancing fusion science and preparing the way for the fusion power plants of tomorrow.

## THE ITER TOKAMAK

The tokamak is an experimental machine designed to harness the energy of fusion. ITER will be the world's largest tokamak, with a plasma radius (R) of 6.2 m and a plasma volume of 840 m<sup>3</sup>.

## ✔ 100,000 KILOMETRES

100,000 kilometres of niobium-tin (Nb<sub>3</sub>Sn) superconducting strands are necessary for ITER's toroidal field magnets. Fabricated by suppliers in six ITER Domestic Agencies—China, Europe, Japan, Korea, Russia and the USA—production began in 2009 and ended in 2014. Over 400 tonnes of this multifilament wire has been produced for ITER at a rate of about 150 tonnes/year, a spectacular increase in worldwide production capacity (estimated, before the scale-up for ITER, at a maximum of 15 tonnes/year). Stretched end to end, the Nb<sub>3</sub>Sn strand produced for ITER would wrap around the Earth at the equator twice.

- Ideal to build stuff with!

Why is it challenging to evaluate such nuclides?

Before I answer, please allow for a quick interlude...

# Cross sections can be split in different regions

Typical evaluated capture cross section

RRR: Resolved Resonance Region  
 URR: Unresolved Resonance Region  
 Fast: Fast-neutron region

# Characterizing the different energy regions

$D \rightarrow$  resonance spacing  
 $\Gamma \rightarrow$  resonance width  
 $\Delta E \rightarrow$  experimental resolution

- RRR:

- Resonances can be individually resolved
- Resonances parametrized individually (R-matrix)

$$\frac{\langle \Gamma \rangle}{\langle D \rangle} \rightarrow \text{small}$$

- URR:

- Resonances cannot be experimentally resolved from one another
- Description based on average cross sections and probability distributions

$$\frac{\langle \Gamma \rangle}{\langle D \rangle} \approx 1; \frac{\Delta E}{\langle D \rangle} \rightarrow \text{big}$$

- Fast:

- Resonances are so wide and so close together that they average each other out
- Measured cross section is smooth

$$\frac{\langle \Gamma \rangle}{\langle D \rangle} \rightarrow \text{big}$$

# Example of opposite case to the nuclei discussed here

FIG. 1. Evaluated [21–26] and experimental  $^{238}\text{U}$  inelastic scattering cross section data [7,8,10–16]. The experimental data marked with \* have been corrected using model calculations.

*Taken from Kerveno et al., PRC104, 044605 (2021)*

- Fast neutron region starts at really low energies
- Cross sections are smooth down to very low energy

# Example of opposite case to the nuclei discussed here

Taken from Kerveno et al., PRC104, 044605 (2021)

- Fast neutron region starts at really low energies
- Cross sections are smooth down to very low energy

# Example of opposite case to the nuclei discussed here

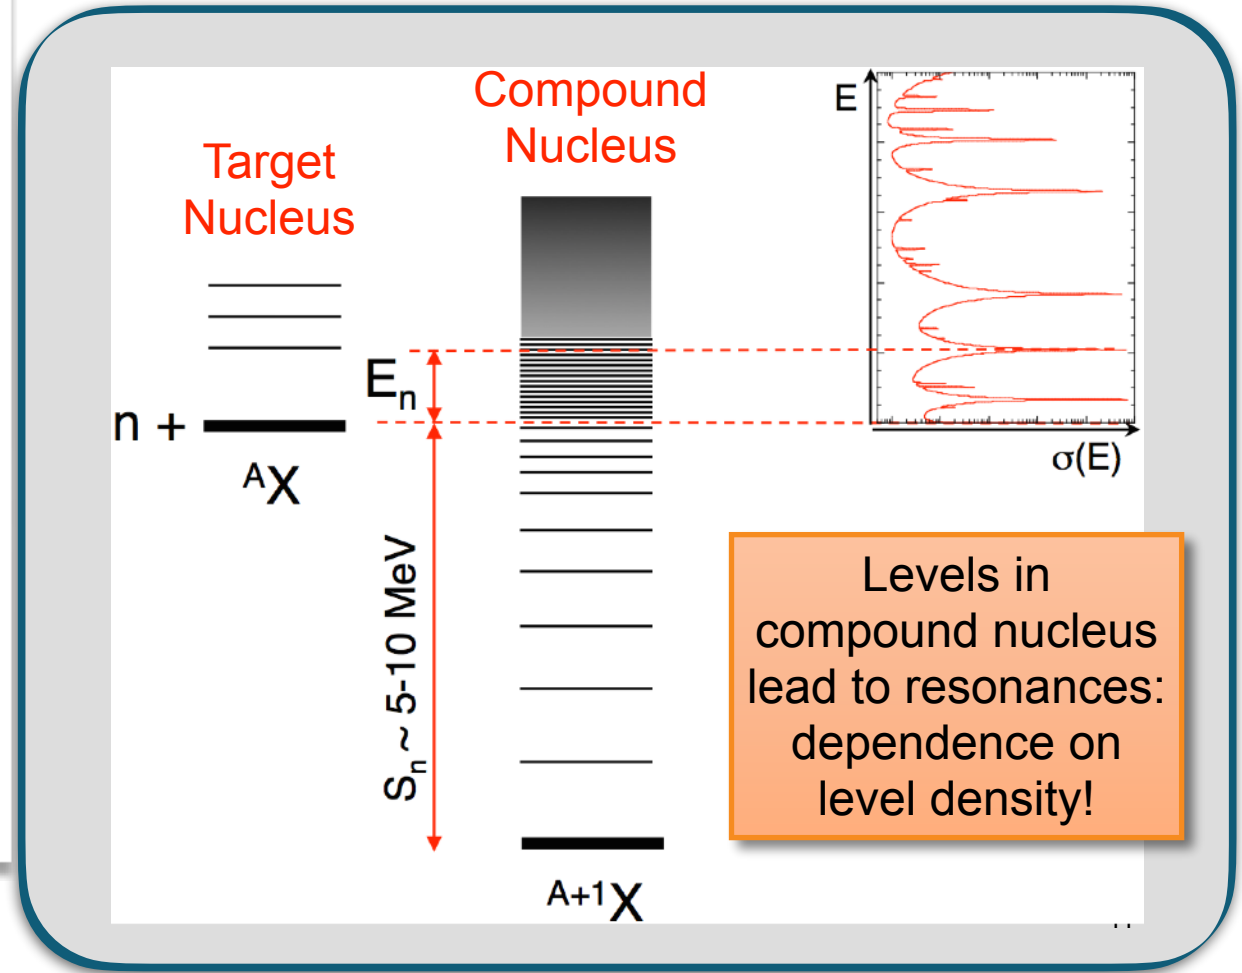

FIG. 1. Evaluated [21–26] and experimental  $^{238}\text{U}$  inelastic scattering cross section data [7,8,10–16]. The experimental data marked with \* have been corrected using model calculations.

Taken from Kerveno et al., PRC104, 044605 (2021)

- Fast neutron region starts at really low energies
- Cross sections are smooth down to very low energy

# Challenges for nuclei discussed here: Low Nuclear Level Densities

- For scattering off  $^{238}\text{U}$ :
  - So many levels even at "0" neutron energy
  - Resonance region ends at 20keV

# Challenges for nuclei discussed here: Low Nuclear Level Densities

- For scattering off  $^{238}\text{U}$ :
  - So many levels even at “0” neutron energy
  - Resonance region ends at 20keV
- For  $^{52}\text{Cr}$ :
  - Even a few MeV above “0” neutron energy there’s a factor of  $10^7$  fewer levels in compound nucleus
  - Cross-section fluctuations extend to much higher energy

# Challenges for nuclei discussed here: Low Nuclear Level Densities

Inelastic threshold of  $^{52}\text{Cr}$

- For scattering off  $^{238}\text{U}$ :
  - So many levels even at “0” neutron energy
  - Resonance region ends at 20keV
- For  $^{52}\text{Cr}$ :
  - Even a few MeV above “0” neutron energy there’s a factor of  $10^7$  fewer levels in compound nucleus
  - Cross-section fluctuations extend to much higher energy

# Challenges for nuclei discussed here:

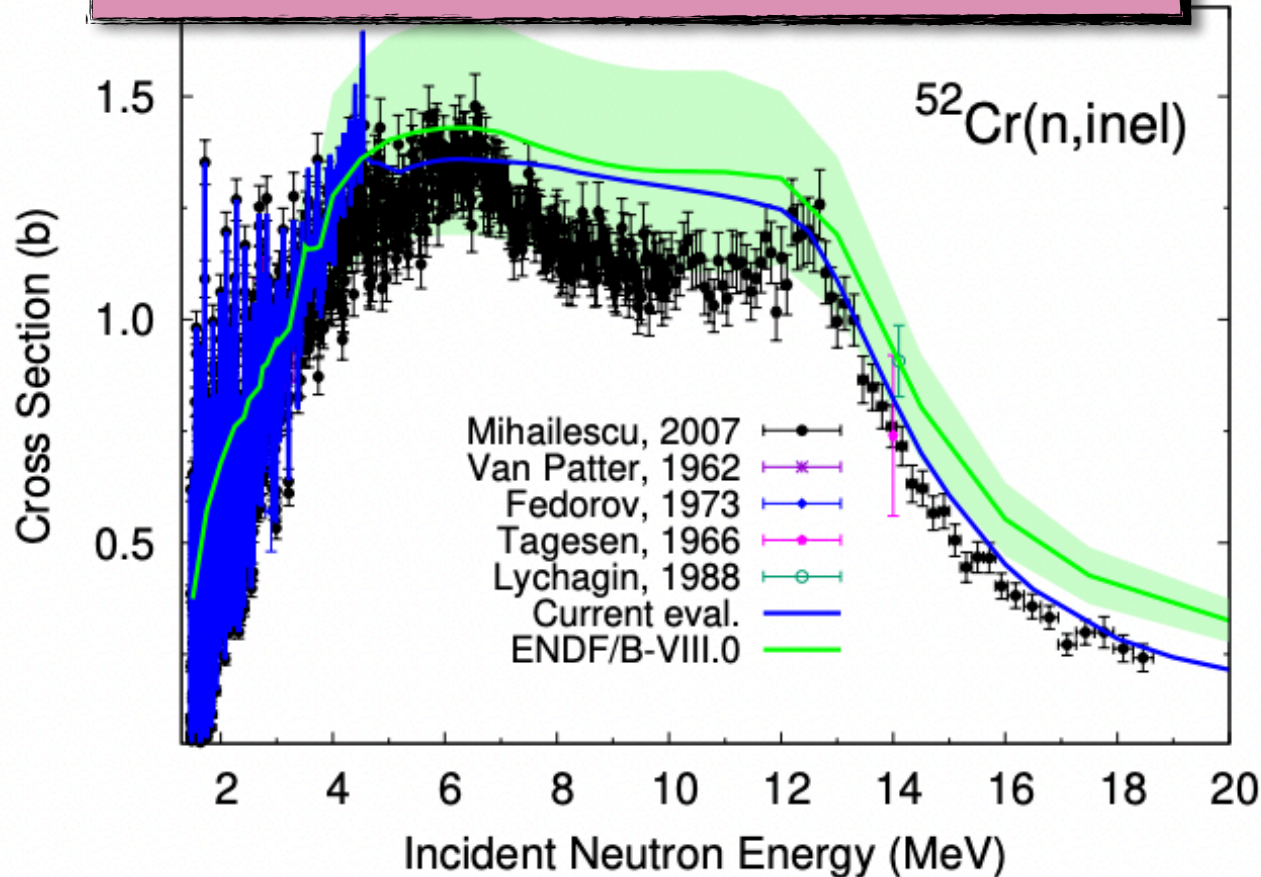

Fluctuations extend to very high energies!

From latest ENDF/B chromium evaluation:  
Nuclear Data Sheets 173 (2021) 1-41

# Challenges for nuclei discussed here:

Fluctuations extend to very high energies!

- No single approach is fully applicable:
  - Cannot use R-matrix like with standalone resonances
  - Cannot use probability distributions as in URR
  - Cannot simply use smooth models from fast regions
- Delicate combination of approaches, model and data
  - E.g., not fully spherical nuclei, not deformed: soft-rotor potentials

From latest ENDF/B chromium evaluation:  
Nuclear Data Sheets 173 (2021) 1-41
