The NDCX-II Engineering Design

Monday, 13 August 2012 11:55 (45 minutes)

W.L. Waldron, W.J. Abraham, D. Arbelaez, W.G. Greenway, J.-Y. Jung, J.W. Kwan, M.L. Leitner, S.M. Lidia, T.M. Lipton, L.R. Reginato, M.J. Regis, P.K. Roy, M.W. Stettler, J.H. Takakuwa, J. Volmering, V.K. Vytla

Lawrence Berkeley National Laboratory, Berkeley, CA, 94720, USA

The Neutralized Drift Compression Experiment (NDCX-II) is a unique user facility for ion-beam-driven High Energy Density Physics (HEDP) and Heavy Ion Fusion (HIF) research located at Lawrence Berkeley National Laboratory (LBNL). The construction phase was completed in March 2012 and the commissioning phase has started with tests of the injector and the first 11 cells of the accelerator. A significant amount of engineering was required to meet the performance parameters required for a wide range of HEDP experiments and simultaneously exploit the hardware available from a decommissioned accelerator. The technical challenges and design of this induction accelerator are described.

This work was performed under the auspices of the U.S. Department of Energy by LBNL under Contract DE-AC02-05CH11231.

Primary author: WALDRON, William (LBNL)

Presenter: WALDRON, William (LBNL)

Session Classification: Program overviews, Chairs: Bill Herrmannsfeldt and Grant Logan
