

The mass composition of ultra-high energy cosmic rays measured by new fluorescence detectors in Telescope Array experiment

Thursday, September 12, 2013 5:00 PM (20 minutes)

The longitudinal development of an extensive air shower reaches its maximum at a depth, X_{\max} , that depends on the species of the primary cosmic ray.

Using a technique based on X_{\max} , we measure the cosmic-ray mass composition from analyses of 3.7 years of monocular-mode operation of the newly constructed fluorescence detectors of the Telescope Array experiment.
