

Search for Supernova Relic Neutrinos with 2.2MeV gamma Tagging at Super-Kamiokande-IV

Wednesday, 11 September 2013 14:20 (20 minutes)

A search for Supernova Relic neutrinos in the energy range $13.3 \text{ MeV} < E_{\bar{\nu}_e} < 31.3 \text{ MeV}$ with neutron tagging at

Super-Kamiokande-IV is conducted. We identify 13 inverse-beta-decay candidates, all of which can be attributed to background. In the absence of signal, 90% C.L. upper limits are calculated with respect to different models. A differential flux upper limit is also given with no model dependence.

Primary author: ZHANG, Yang (-)

Presenter: ZHANG, Yang (-)

Session Classification: Low Energy Neutrinos III

Track Classification: Low-Energy Neutrinos (solar, reactor, supernova, and geo neutrinos and also nuclear astrophysics associated with these sources)
